

**1)** Selenium allows a developer to test a website's functionality quickly and automatically. Web sites usually have many different pages that need to be tested and manual testing is a very tedious job. By writing a test in Selenium, a tester can easily perform regression tests without hassle.

**2)** Selenium can be a bit buggy and so failed tests might not be a failure of the system. Also, major changes in a website might break the Selenium tests and force the tester to recreate them.

**3)** `<tr><td><a href="myCase.html">MyCase</a></td></tr>`

**4)**

```
<tr>
    <td>click</td>
    <td>//a[@id='myLink']/</td>
    <td></td>
</tr>
```

**5)** Selenium is a website testing tool that would be used by people familiar with HTML. By using HTML Selenium simplifies the learning experience for new users and also ensures compatibility with a variety of testing environments.

A drawback would be the overly complicated syntax for writing Selenium code. A simpler syntax and an easier style could have been used if HTML was avoided.
